

Full AP233 OWL Ontology with concepts for Analysis in Support of Decision Making

Harold P. Frisch

ISO-SC4 Meeting
HangZhou China

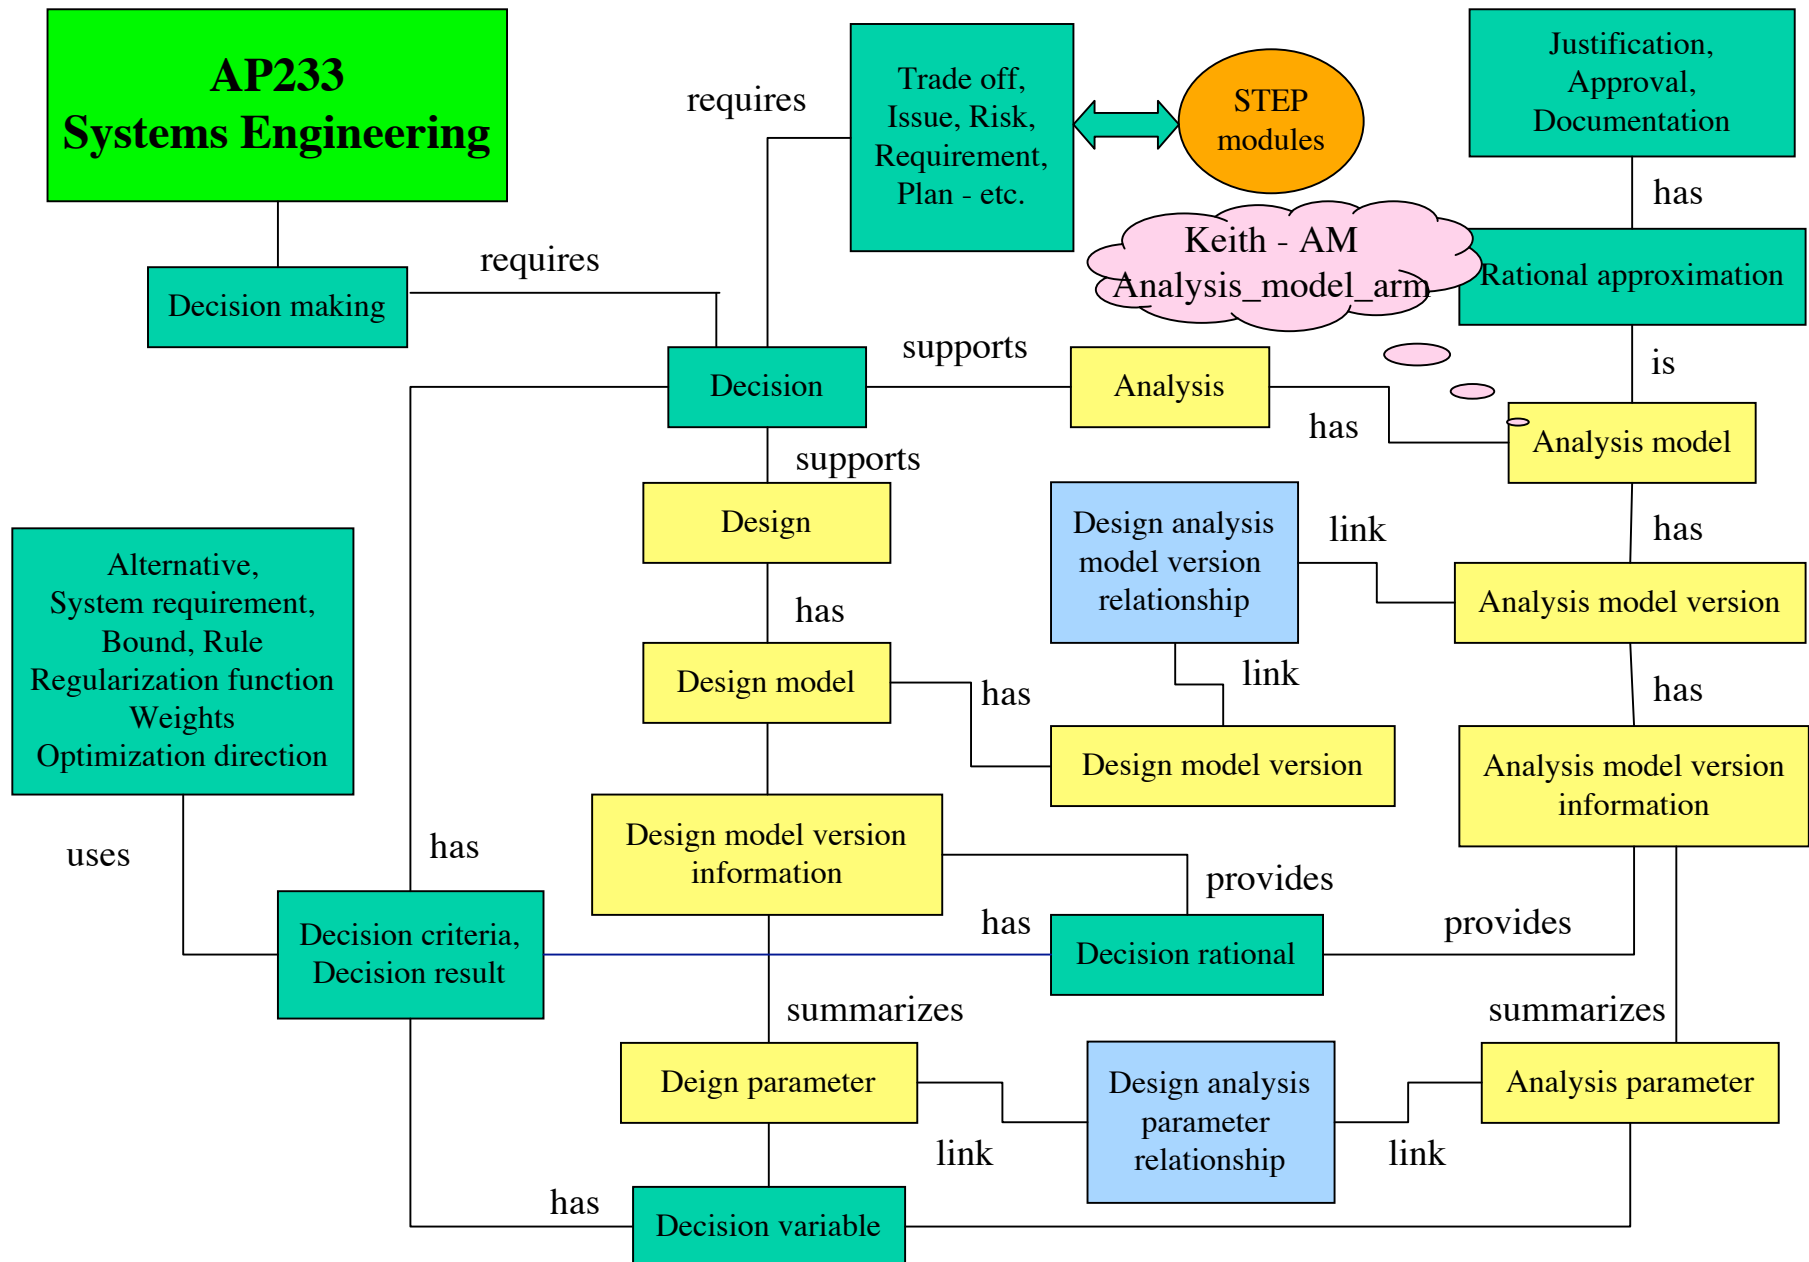

Oct-2005

Translation Key - Concept Model Block Diagrams to Protégé OWL Model

- **Boxes** translate to Protégé **Classes**
 - Concept Model Semantic dictionary defines all “box” concepts
 - Select sets of subclasses can be identified as mutually disjoint
 - Inheritance (generalization/specialization) requirements can be identified
- **Lines** translate to Protégé **Properties**
 - Line titles are natural language labels without definition
 - Restrictions (characterization) of properties captured in Concept Model Draft 13 pidgen UML symbol list
 - Most symbols translate to Protégé OWL representation capability
 - E.g., Generalization/specialization --> Super/sub class inheritance
 - In Protégé the relationships between classes (properties) need to be made more precise, I tried
 - Create “classProperty” natural language property descriptors (labels)
 - Protégé allows for additional property characterization
 - Inverse - extensively used
 - Transitive - Not used
 - Functional, InverseFunctional - Some use
 - Symmetric - Not used

Analysis in Support of Decision Making Oct-2005

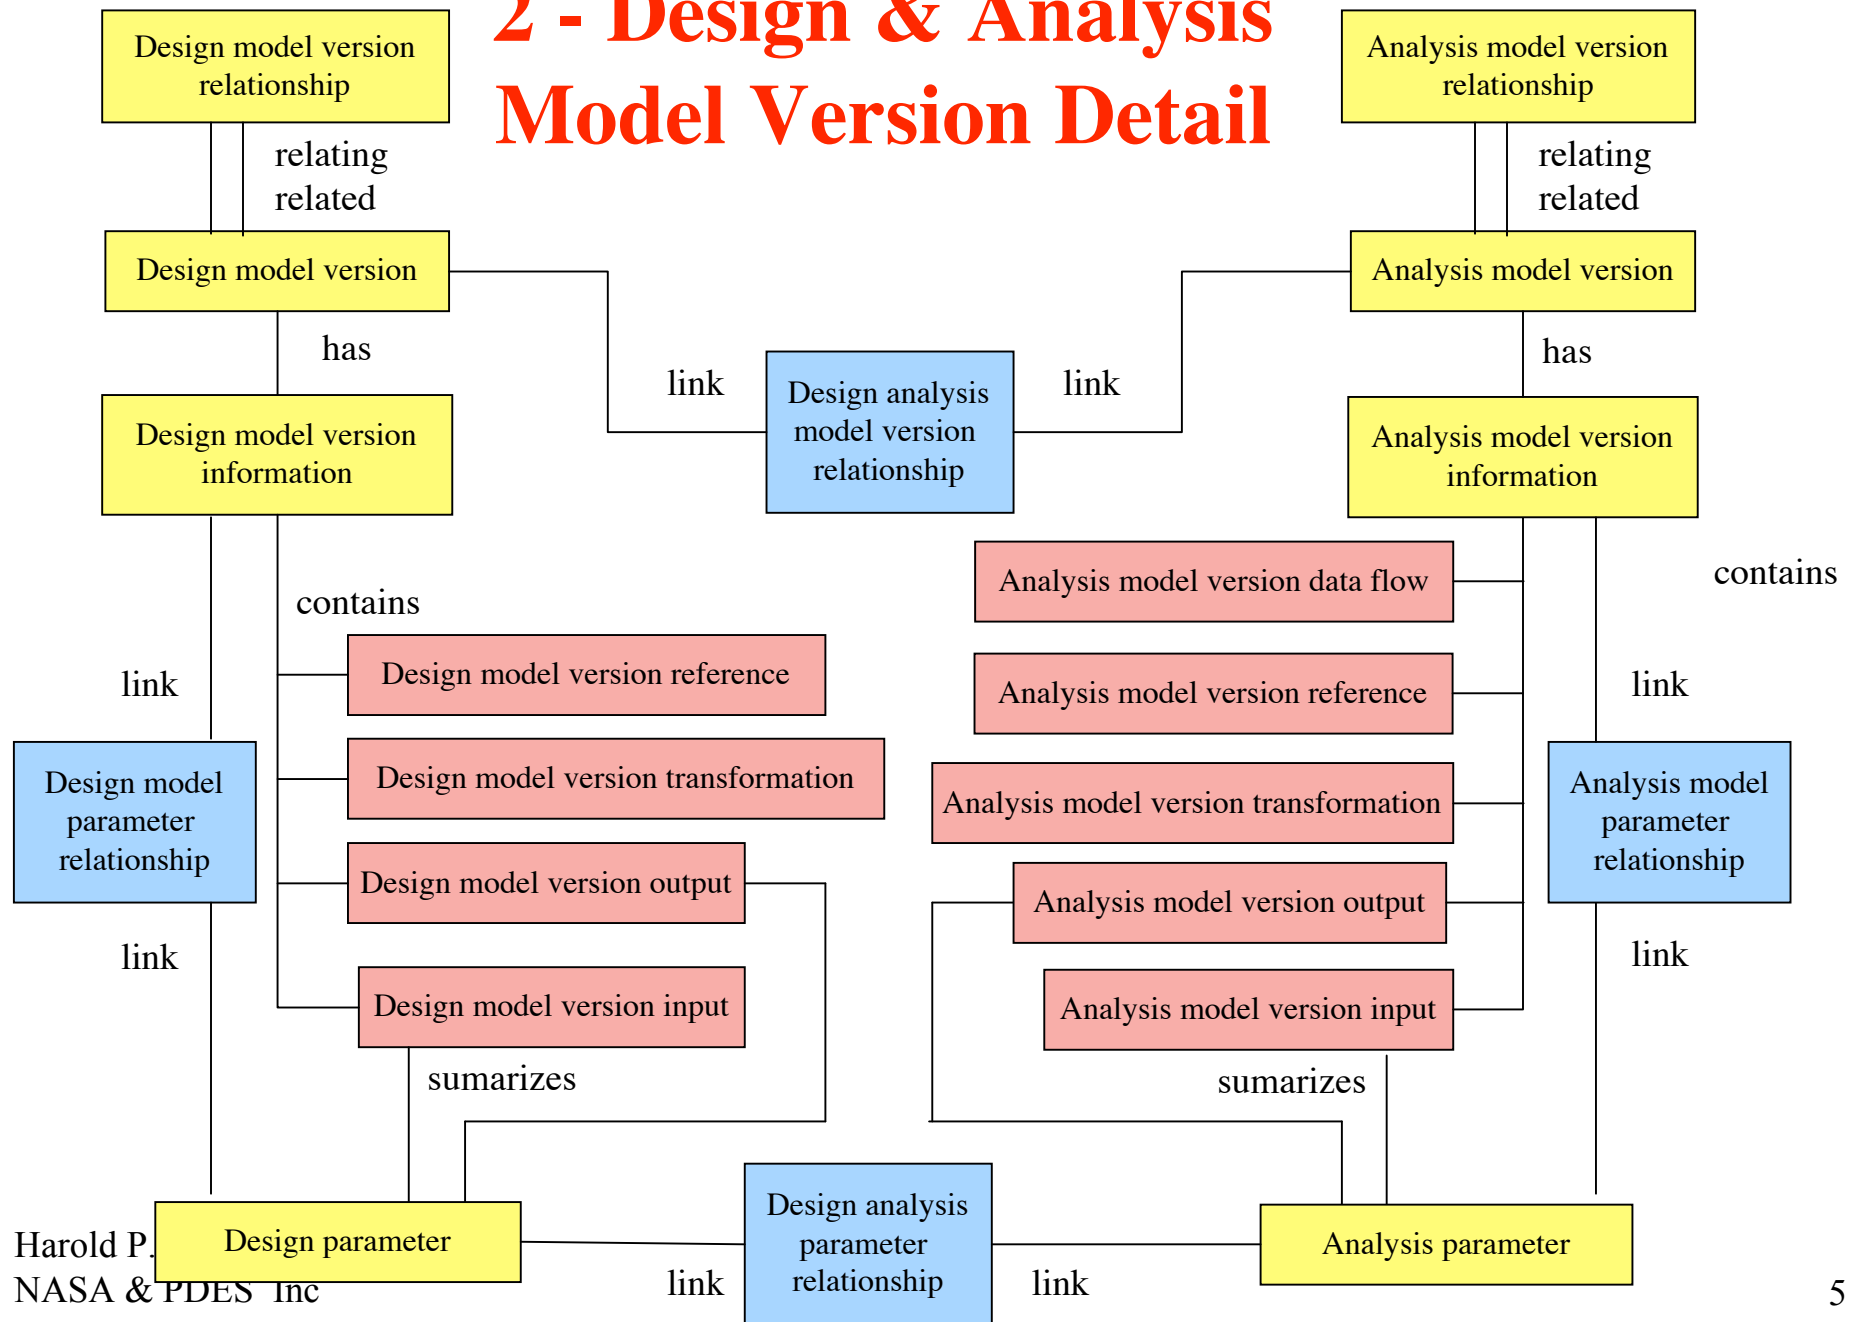

PDES Offsite Review Inputs included

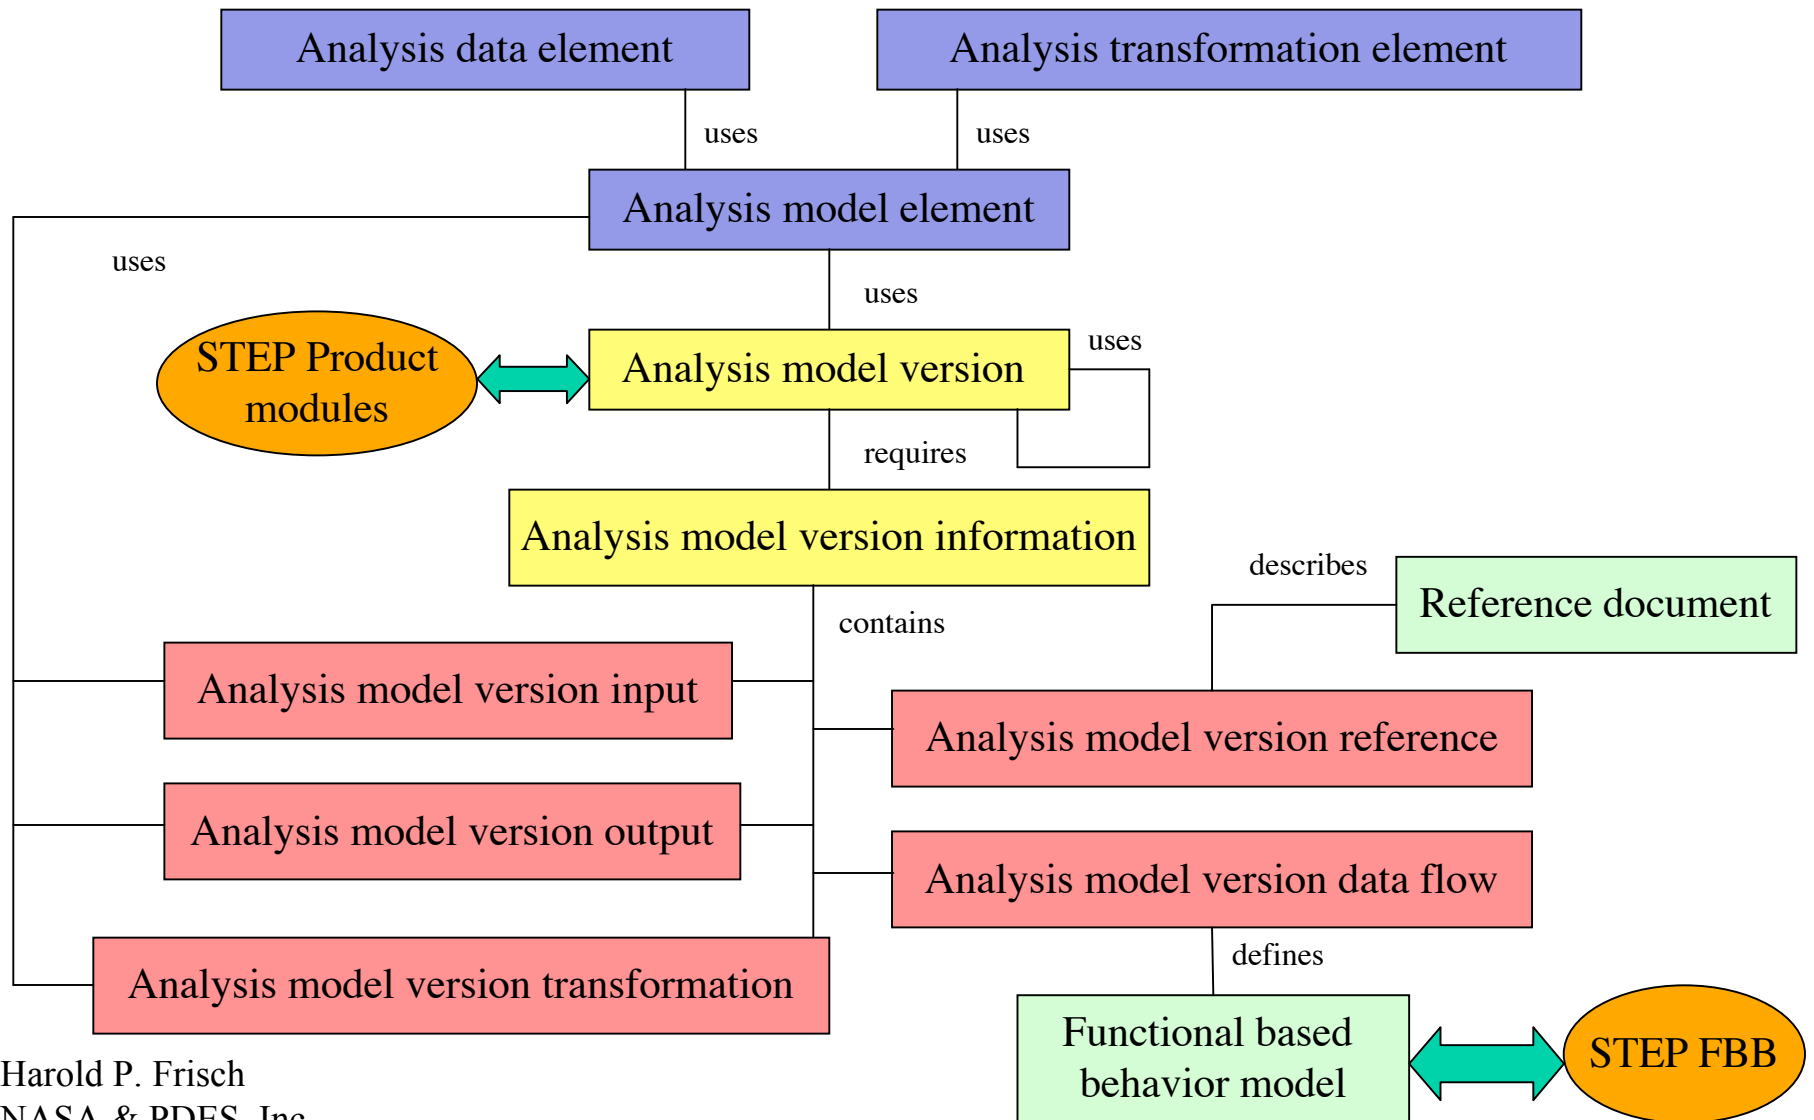

Harold P. Frisch

NASA & IDL 1 - Overview - Analysis in support of decision making

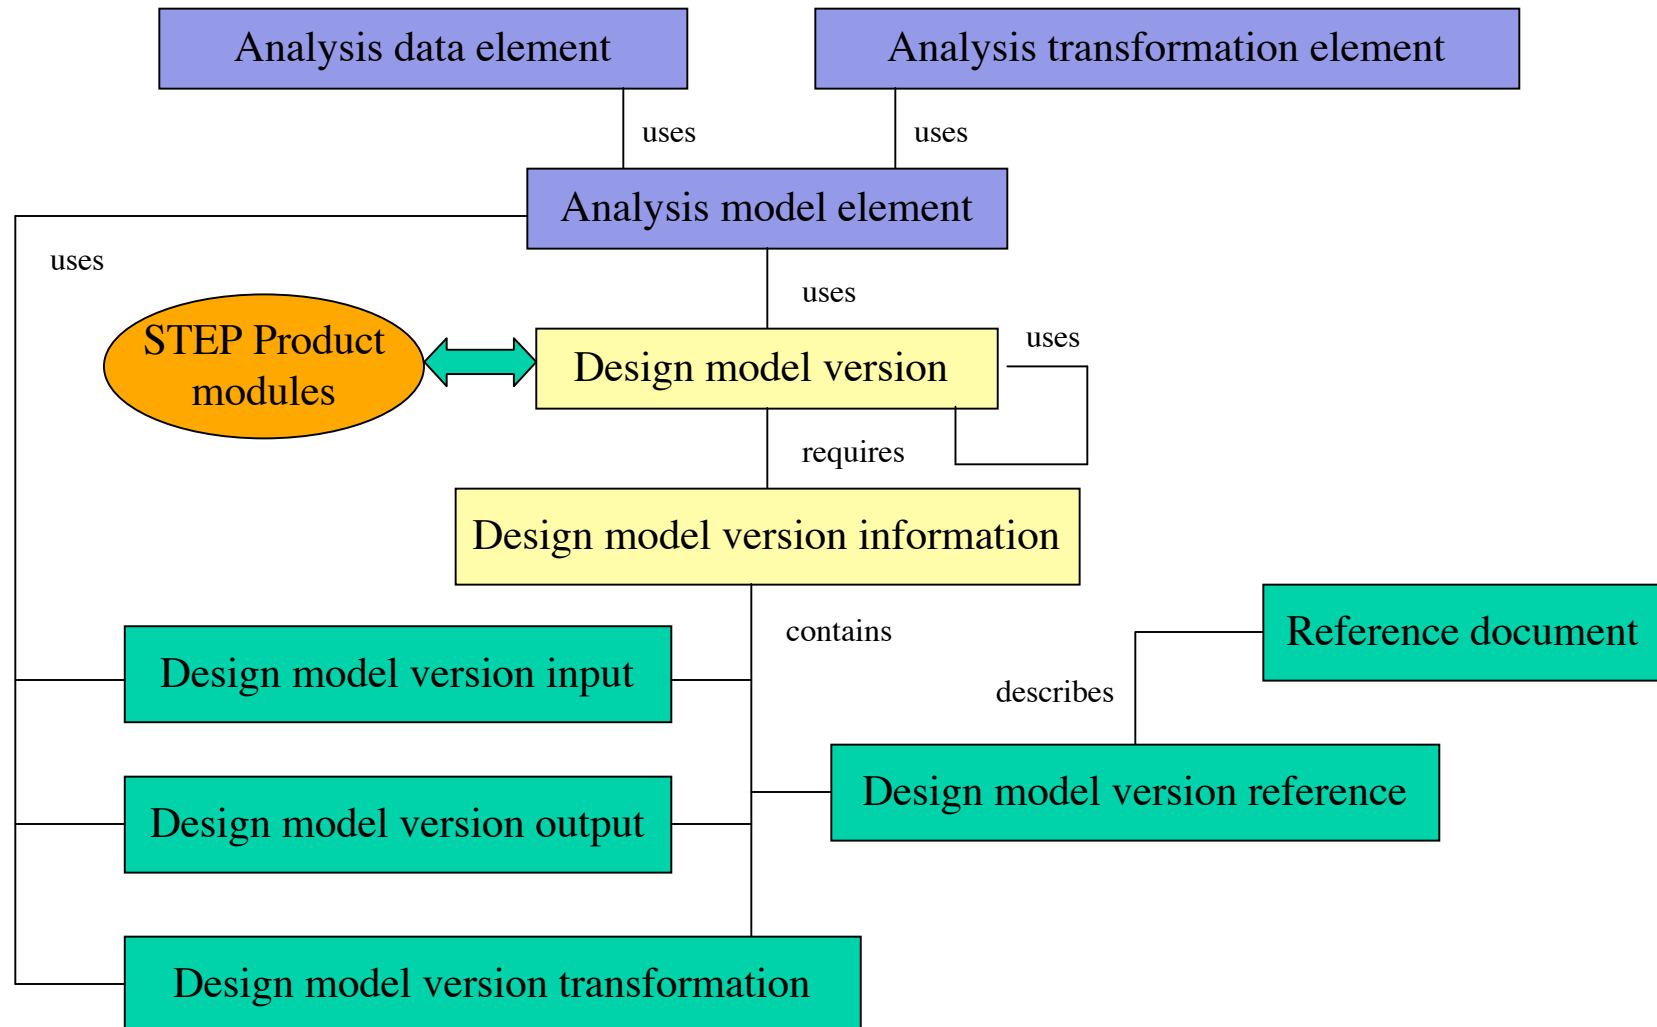

2 - Design & Analysis Model Version Detail

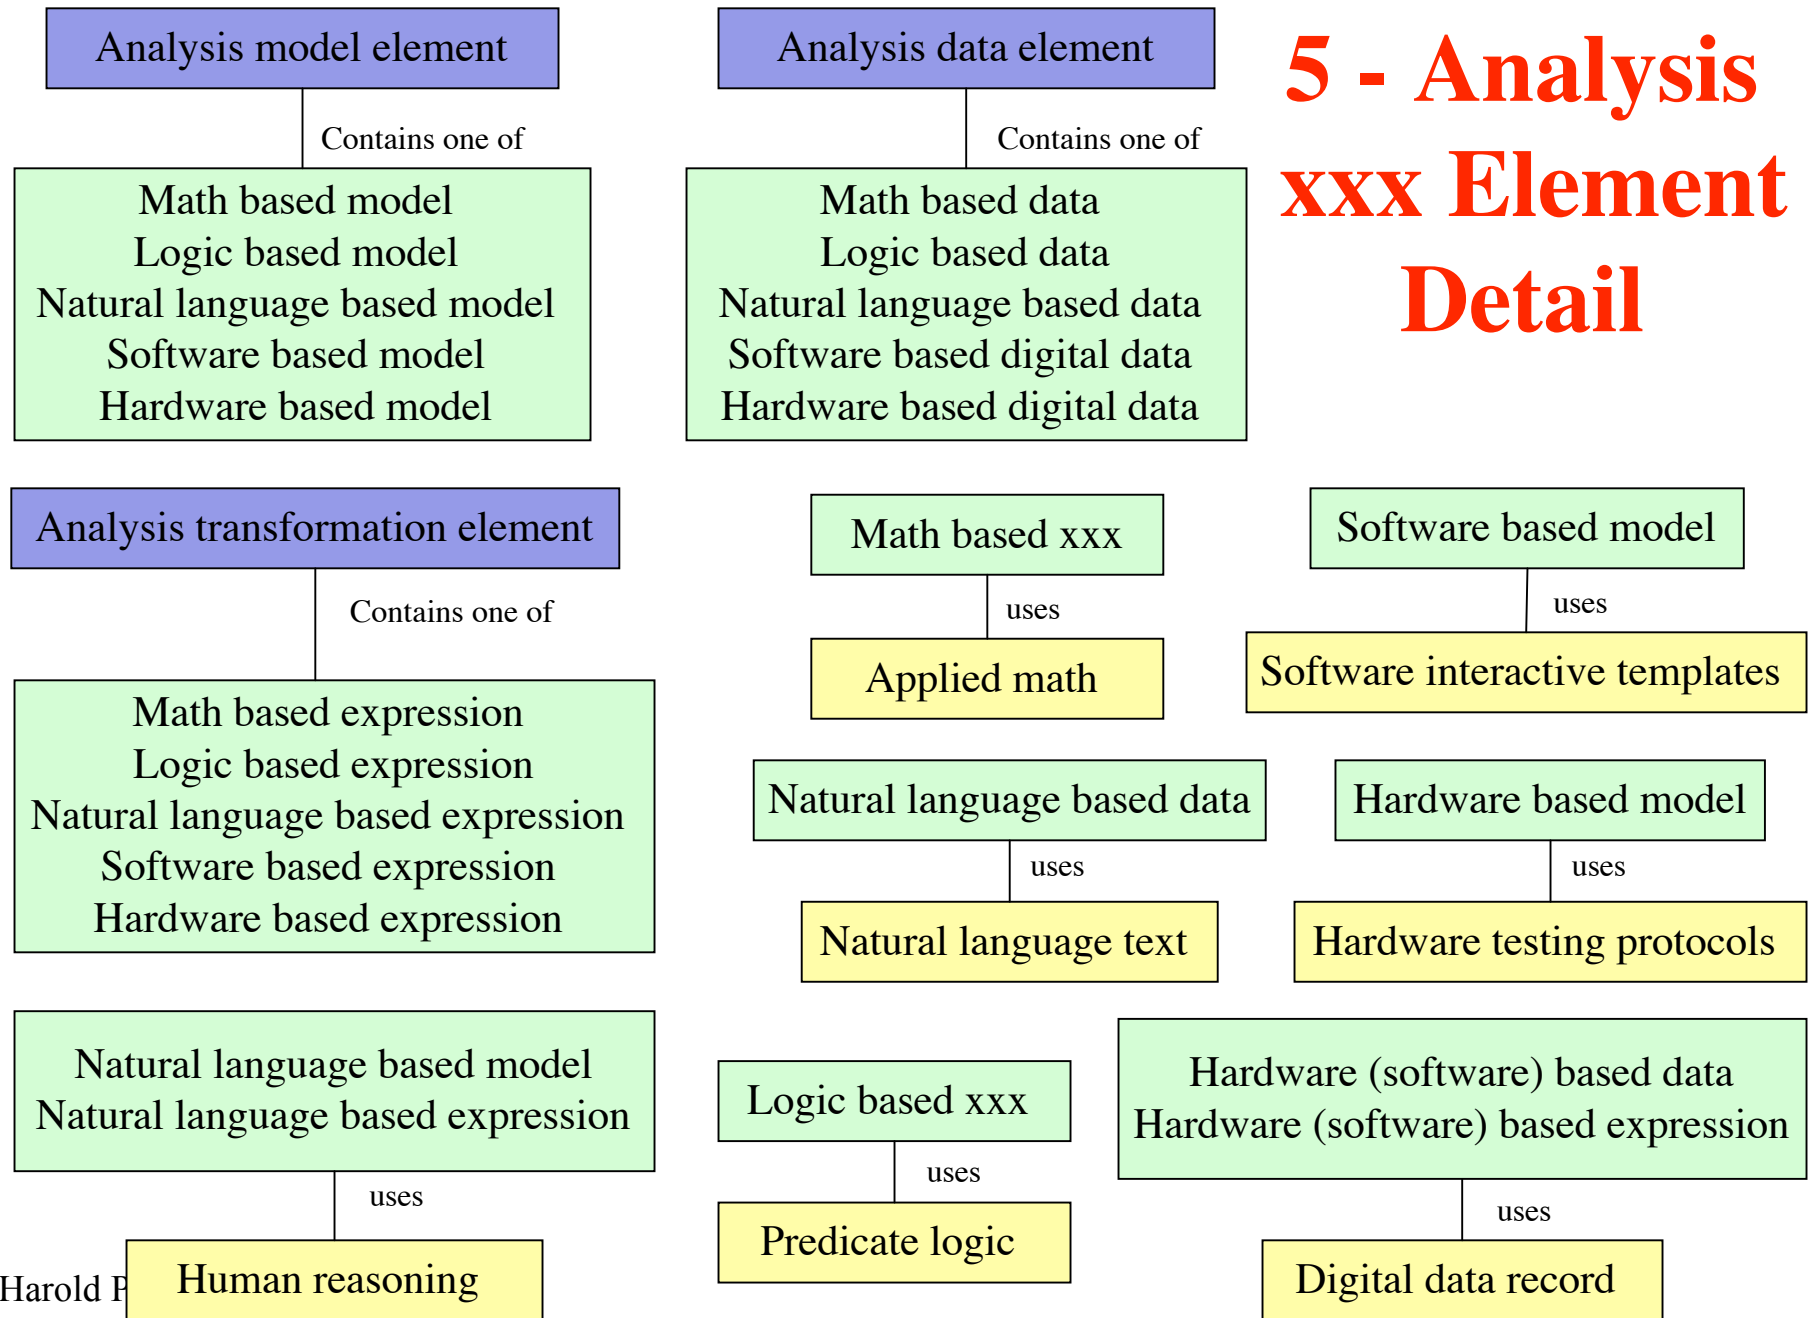

3 - Analysis Model Version Information Detail

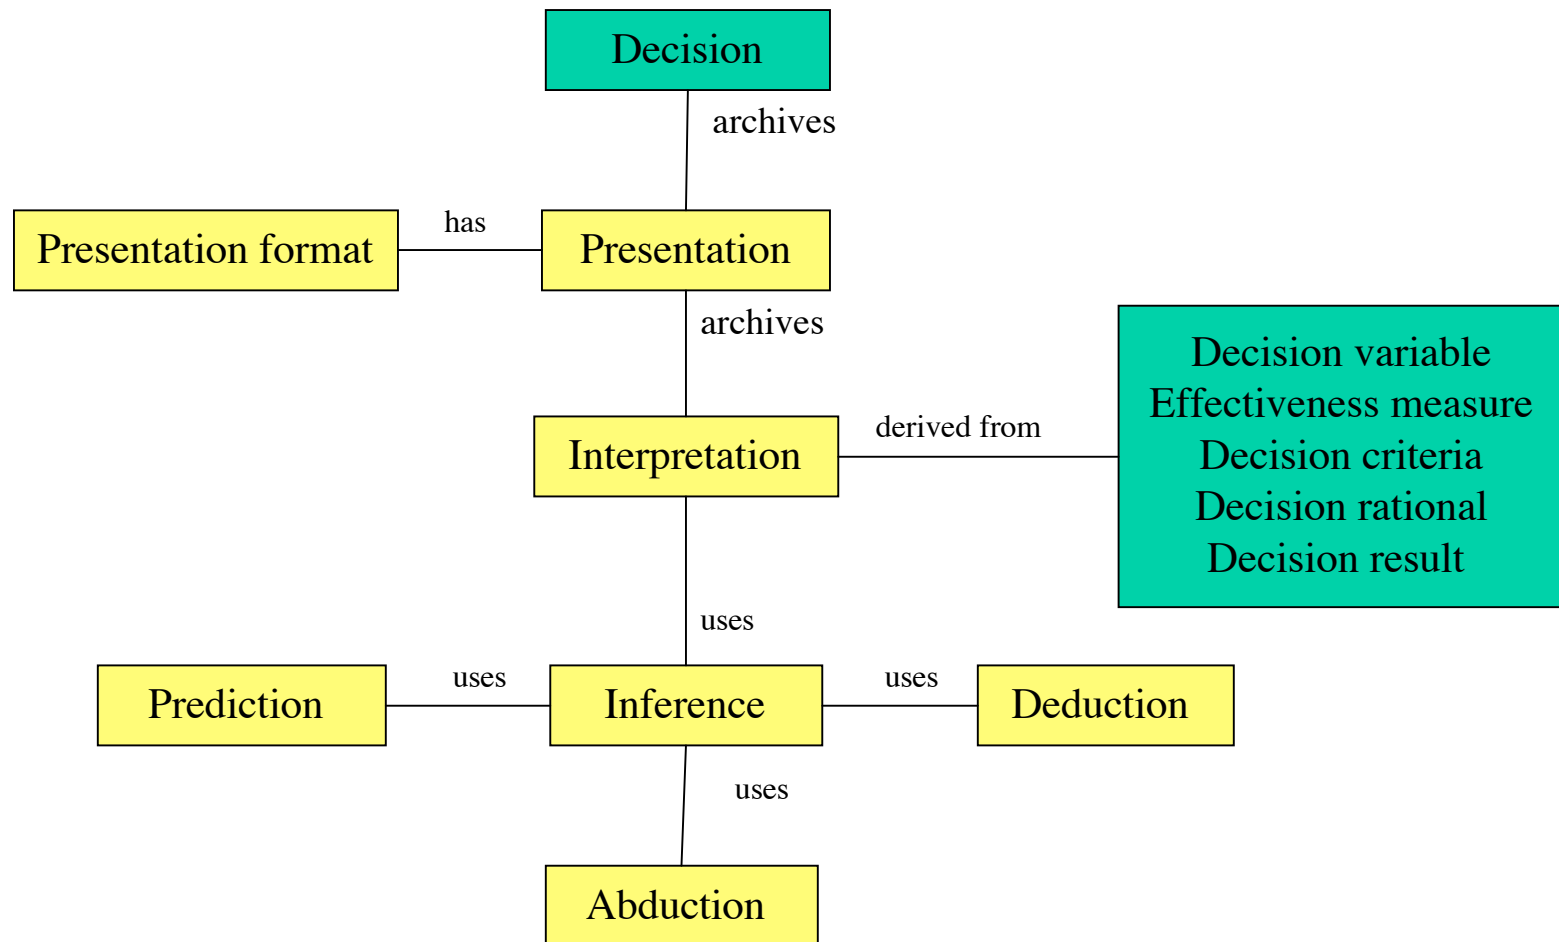

4 - Design Model Version Information Detail

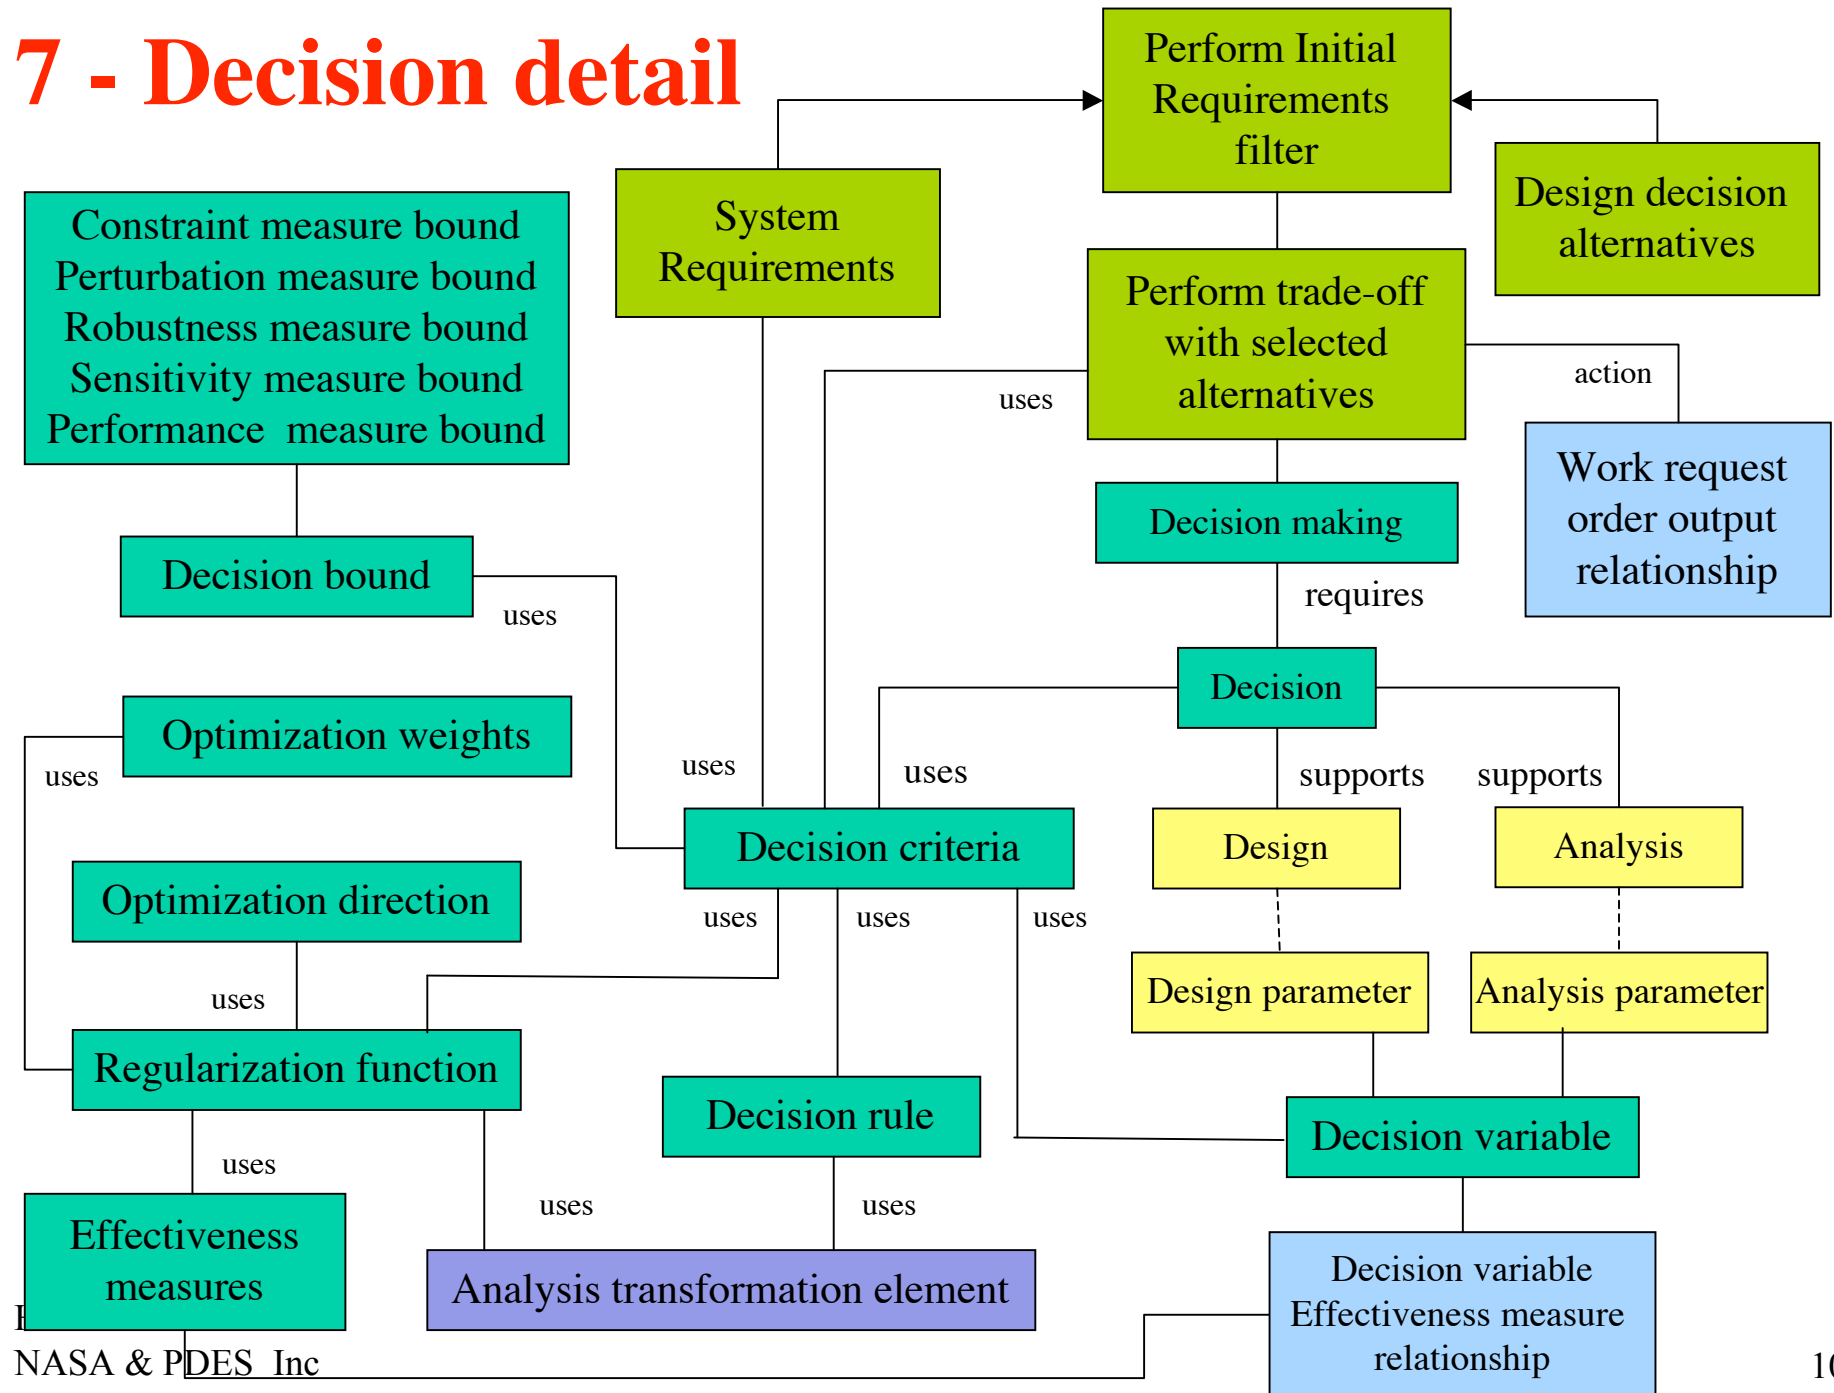

5 - Analysis xxx Element Detail

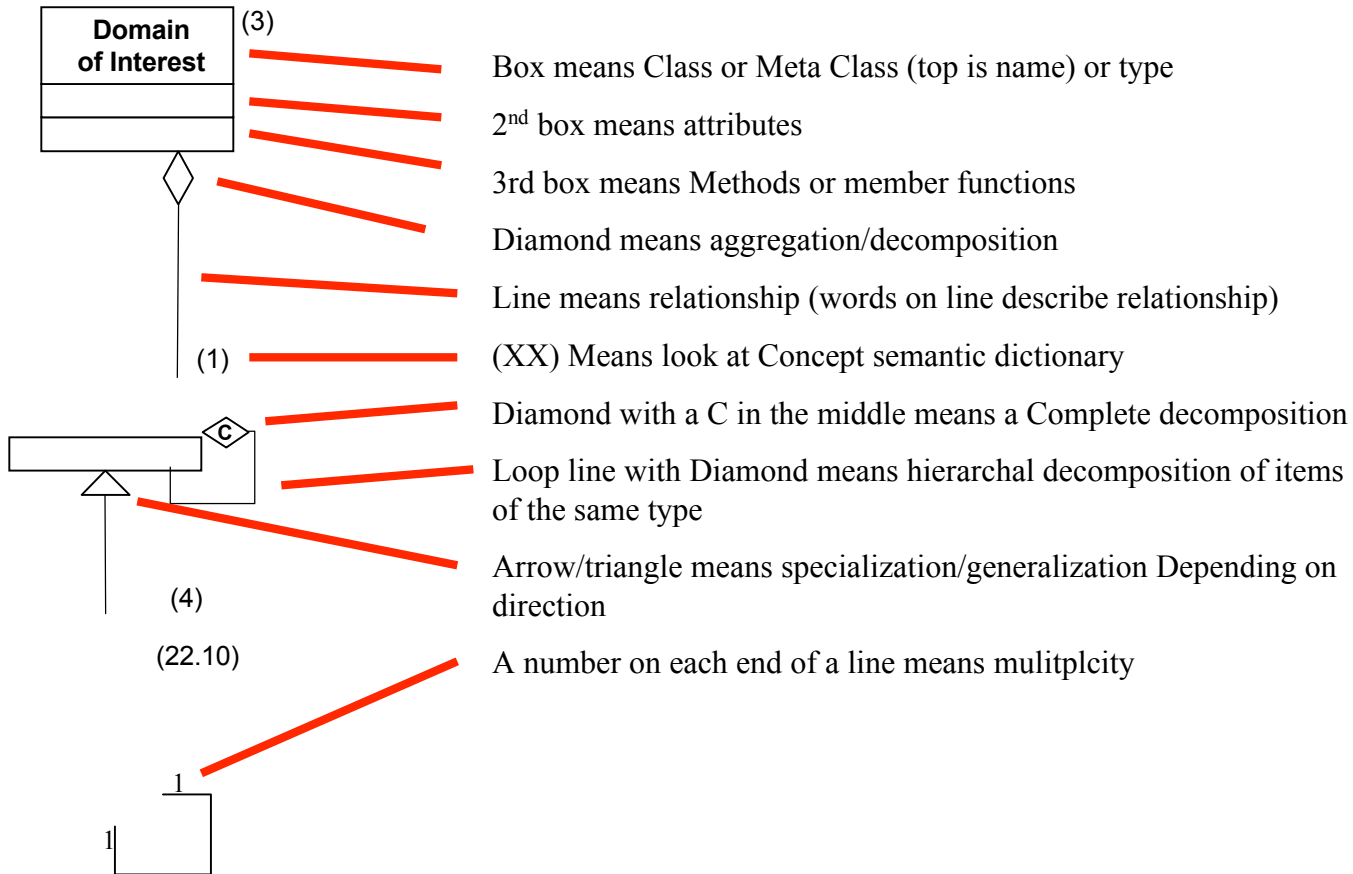

6 - Decision supported by Interpretation & Presentation

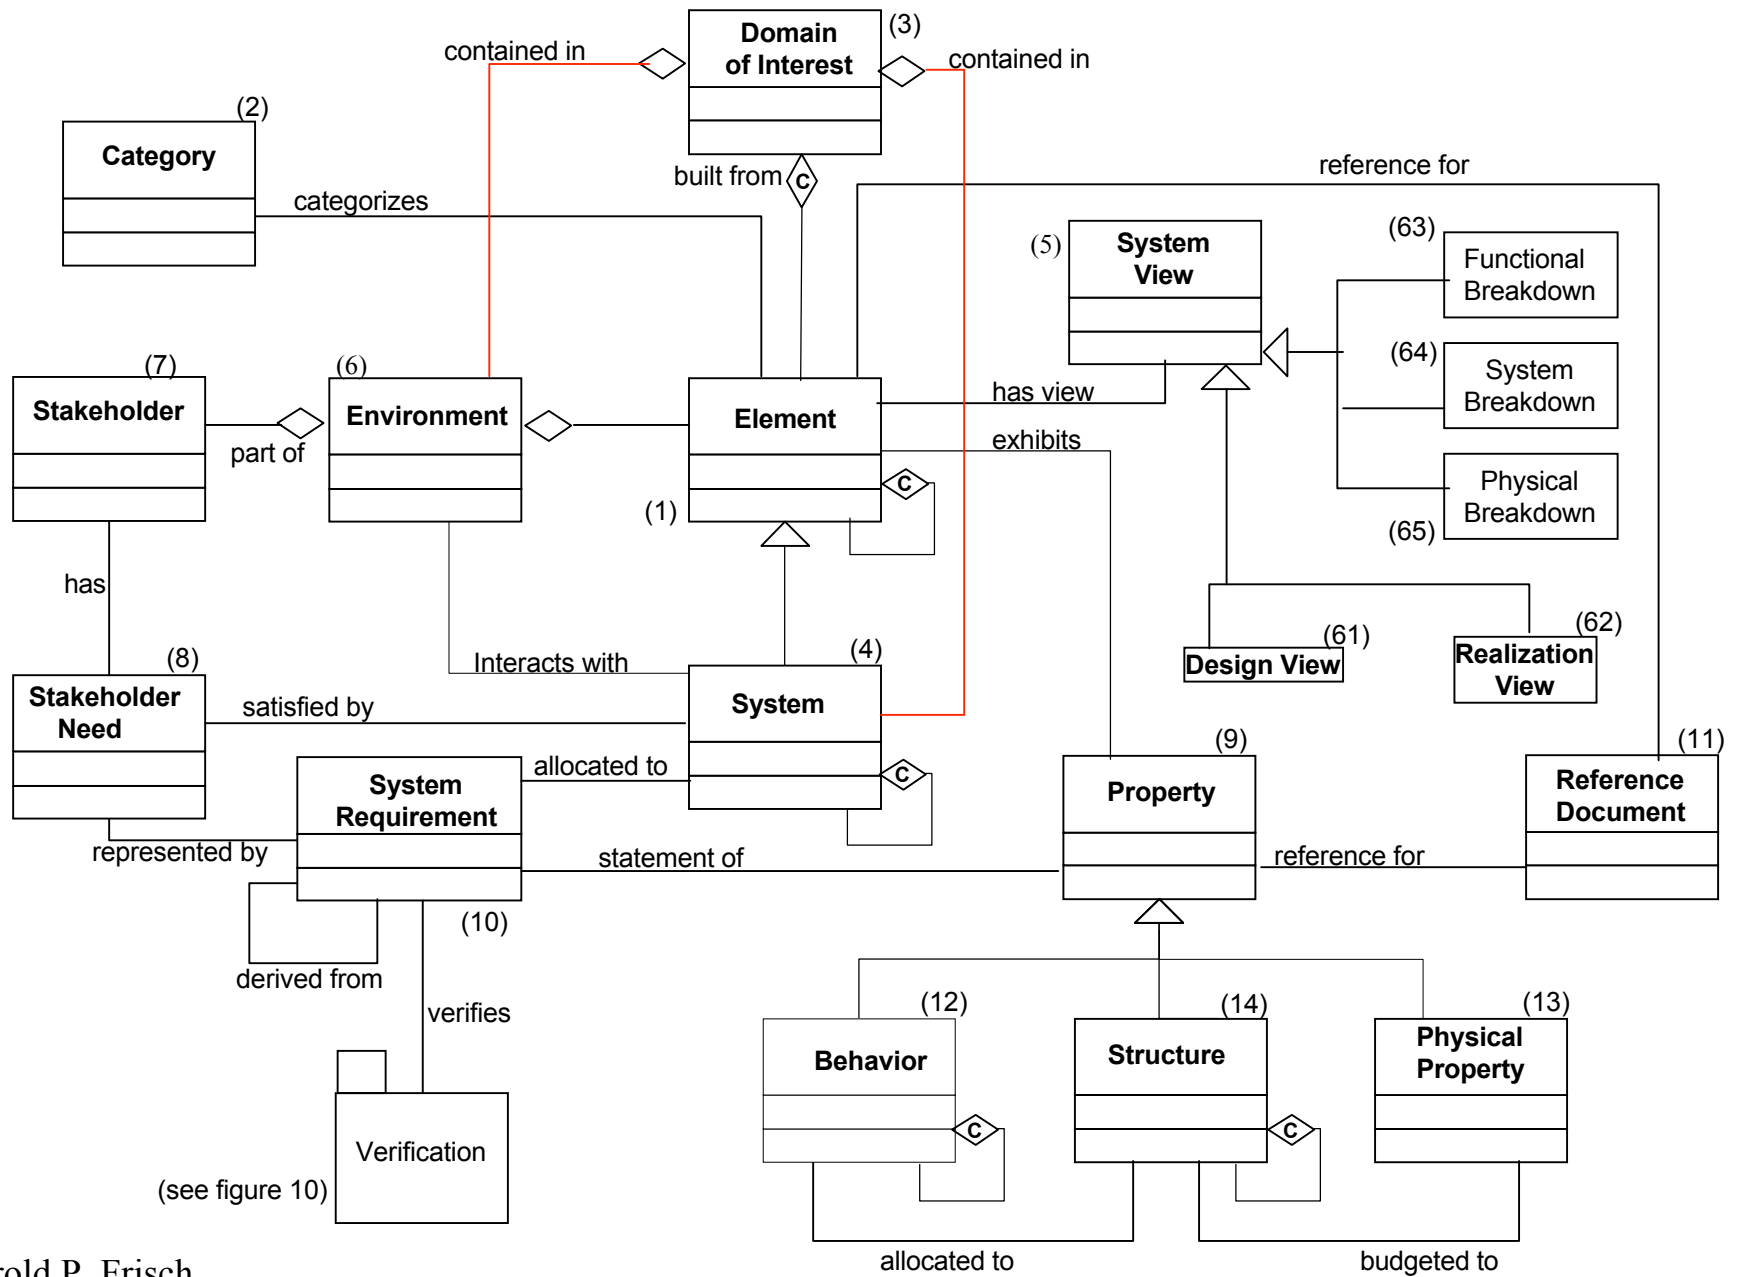

7 - Decision detail

System Engineering Definitions for pigeon UML

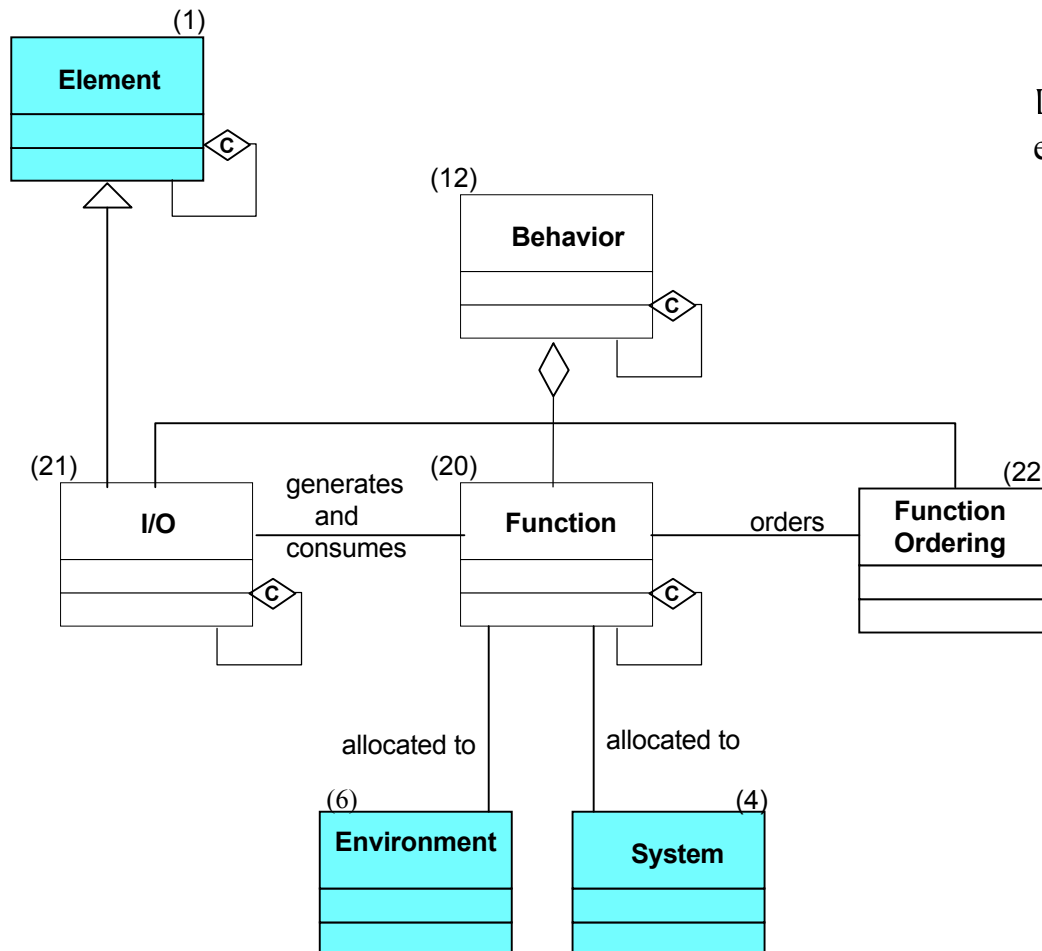

AP 233 Concept Model
Draft #13
07-28-2005

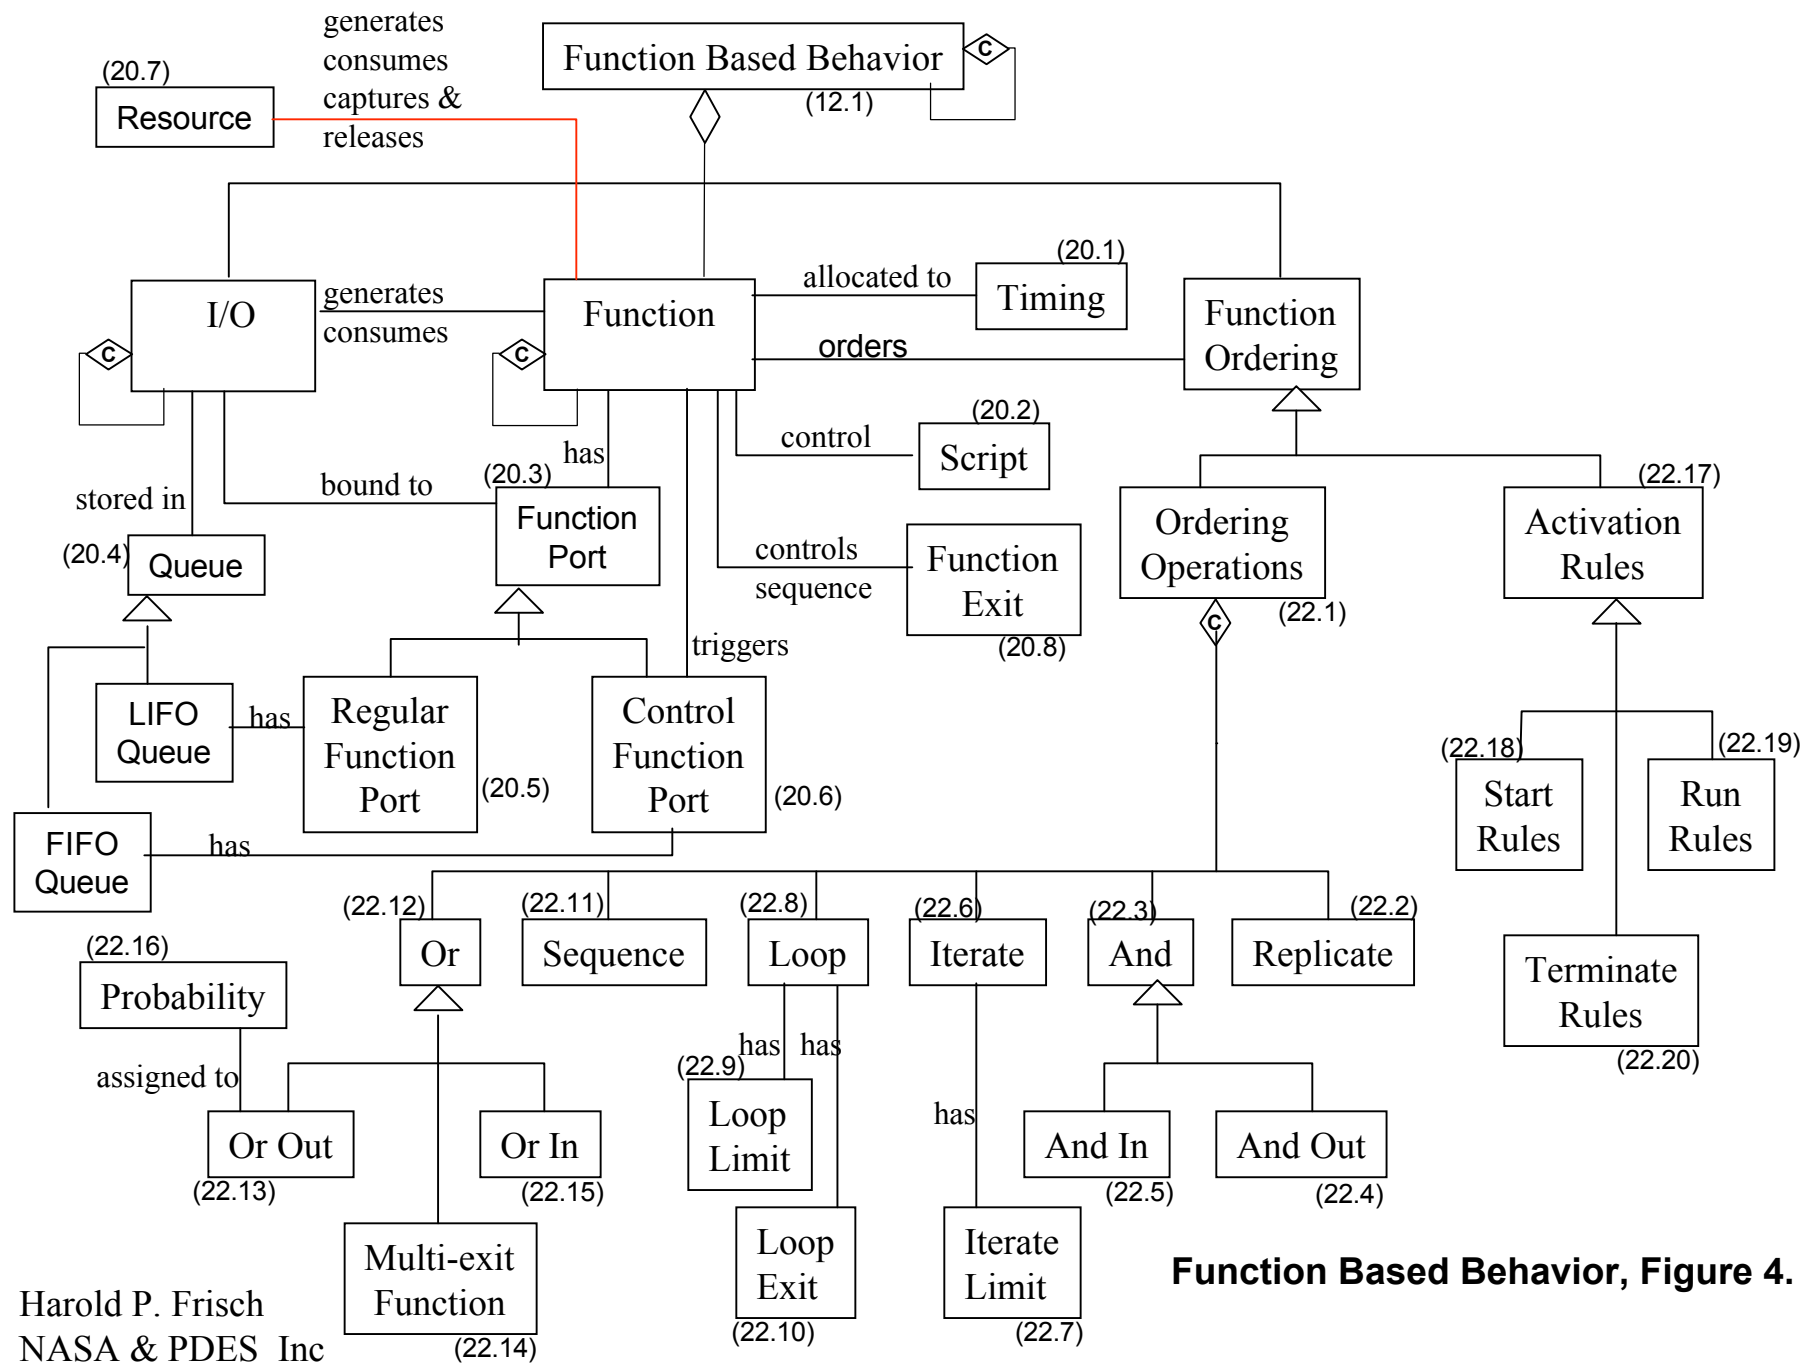

Harold P. Frisch
